Assessment comments

Example 3: SLP1

Subject: Economics

Component: SL paper 1

Question 1 Part	Marks awarded	Marks available	Comments
(a)	6	10	The context of the question is quite well set out, but the introduction could be clearer. The explanation of a subsidy on computers is quite well made. The diagram looks logical, but the axes are labelled incorrectly. There is an error in the explanation of the subsidy. The explanation of a maximum price to promote equity is quite well made, but the diagram carries the same labelling errors as the previous one. Equity needs to be explained more clearly. The answer contains some errors and needs more accurate diagrams as well as terminology use. Six marks are awarded.
(b)	10	15	The answer starts with a good real-world example. The diagram looks correct, but the labels are on the wrong axes. So, the answer loses some credit here. The explanation of the tax put on producers is correctly explained and applies to the real-world evidence (RWE). The section on consumer reaction is quite well drafted and has an evaluative approach, but it could use more theory. The impact on government revenue is correct based on the diagram. The point about the impact on producers in other markets is well made. The conclusion has an evaluative feel. This answer has some technical weaknesses (i.e. the diagram), but it uses the RWE well and offers good evaluation. 10 marks are awarded.
