

MY APPLE DUO STORY

Which behavioural bias is being illustrated?

Look at each scene, read the story and decide which behavioural bias is being shown.

1

Alex saw an advert with a crossed-out price of \$2,500 and a special offer price of \$1,999. He had no idea what it should actually cost, but the original figure made the new price seem like a bargain.

Why do you think this influences Alex?

2

The same package cost exactly the same amount, but this time it was advertised as "less than \$55 per week". It suddenly felt much more affordable, and Alex focused on the smaller weekly figure.

3

Alex remembered seeing lots of social posts and YouTubers praising the Apple Duo. These examples came to mind easily, so he assumed it must be the best device, and paid less attention to negative reviews.

4

Alex found hundreds of reviews, specifications, prices and contract options. It was too much information to compare, so eventually he thought, "I've spent enough time on this already. I'll just choose something that seems good enough."

5

As he walked past an Apple Store, Alex saw a sign describing the Apple Duo as the company's newest flagship product. He thought, "Apple products are always high quality. Whenever I buy Apple, I never regret it." This simple rule made his decision easy.

6

Alex had planned to wait three months and pay in full, but the salesperson offered a payment plan so he could take it home immediately. The excitement of owning it and showing it to his friends the next day was too difficult to resist.

Why do you think this influences Alex?

7

Just before paying, the salesperson showed Alex a premium case at a high price. He explained that part of the price would be donated to a charity supporting children's education. Alex realised a cheaper case was available, but he still bought the expensive one, feeling good that it might help others.

8

When Alex arrived home, he believed he had made a carefully considered decision. But in reality, his judgement may have been influenced by several predictable patterns in human behaviour.

Which behavioural biases do you think influenced Alex overall?
Did he truly maximise his benefit at the lowest possible cost? Why or why not?
